Extensions for Financial Services (XFS) interface specification  
Release 3.20 - Part 13: Alarm Device Class Interface  
Programmer's Reference

This CEN Workshop Agreement has been drafted and approved by a Workshop of representatives of interested parties, the constitution of which is indicated in the foreword of this Workshop Agreement.

The formal process followed by the Workshop in the development of this Workshop Agreement has been endorsed by the National Members of CEN but neither the National Members of CEN nor the CEN-CENELEC Management Centre can be held accountable for the technical content of this CEN Workshop Agreement or possible conflicts with standards or legislation.

This CEN Workshop Agreement can in no way be held as being an official standard developed by CEN and its Members.

This CEN Workshop Agreement is publicly available as a reference document from the CEN Members National Standard Bodies.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This CWA is revision 3.20 of the XFS interface specification.

This CEN Workshop Agreement has been drafted and approved by a Workshop of representatives of interested parties on 2011-06-29, the constitution of which was supported by CEN following the public call for participation made on 1998-06-24. The specification is continuously reviewed and commented in the CEN/ISSS Workshop on XFS. It is therefore expected that an update of the specification will be published in due time as a CWA, superseding this revision 3.20.

A list of the individuals and organizations which supported the technical consensus represented by the CEN Workshop Agreement is available to purchasers from the CEN-CENELEC Management Centre. These organizations were drawn from the banking sector. The CEN/ISSS XFS Workshop gathered suppliers as well as banks and other financial service companies.

The CWA is published as a multi-part document, consisting of:

Part 1: Application Programming Interface (API) - Service Provider Interface (SPI) - Programmer's Reference
Part 2: Service Classes Definition - Programmer's Reference
Part 3: Printer and Scanning Device Class Interface - Programmer's Reference
Part 4: Identification Card Device Class Interface - Programmer's Reference
Part 5: Cash Dispenser Device Class Interface - Programmer's Reference
Part 6: PIN Keypad Device Class Interface - Programmer's Reference
Part 7: Check Reader/Scanner Device Class Interface - Programmer's Reference
Part 8: Depository Device Class Interface - Programmer's Reference
Part 9: Text Terminal Unit Device Class Interface - Programmer's Reference
Part 10: Sensors and Indicators Unit Device Class Interface - Programmer's Reference
Part 11: Vendor Dependent Mode Device Class Interface - Programmer's Reference
Part 12: Camera Device Class Interface - Programmer's Reference
Part 13: Alarm Device Class Interface - Programmer's Reference
Part 14: Card Embossing Unit Class Interface - Programmer's Reference
Part 15: Cash-In Module Device Class Interface - Programmer's Reference
Part 16: Card Dispenser Device Class Interface - Programmer's Reference
Part 17: Barcode Reader Device Class Interface - Programmer's Reference
Part 18: Item Processing Module Device Class Interface - Programmer's Reference
Parts 19 - 28: Reserved for future use.
Parts 29 through 47 constitute an optional addendum to this CWA. They define the integration between the SNMP standard and the set of status and statistical information exported by the Service Providers.

Part 29: XFS MIB Architecture and SNMP Extensions
Part 30: XFS MIB Device Specific Definitions - Printer Device Class
Part 31: XFS MIB Device Specific Definitions - Identification Card Device Class
Part 32: XFS MIB Device Specific Definitions - Cash Dispenser Device Class
Part 33: XFS MIB Device Specific Definitions - PIN Keypad Device Class
Part 34: XFS MIB Device Specific Definitions - Check Reader/Scanner Device Class
Part 35: XFS MIB Device Specific Definitions - Depository Device Class
Part 36: XFS MIB Device Specific Definitions - Text Terminal Unit Device Class
Part 37: XFS MIB Device Specific Definitions - Sensors and Indicators Unit Device Class
Part 38: XFS MIB Device Specific Definitions - Camera Device Class
Part 39: XFS MIB Device Specific Definitions - Alarm Device Class
Part 40: XFS MIB Device Specific Definitions - Card Embossing Unit Device Class
Part 41: XFS MIB Device Specific Definitions - Cash-In Module Device Class
Part 42: Reserved for future use.
Part 43: XFS MIB Device Specific Definitions - Vendor Dependent Mode Class
Part 44: XFS MIB Application Management
Part 45: XFS MIB Device Specific Definitions - Card Dispenser Device Class
Part 46: XFS MIB Device Specific Definitions - Barcode Reader Device Class
Part 47: XFS MIB Device Specific Definitions - Item Processing Module Device Class
Parts 48 - 60 are reserved for future use.
Part 61: Application Programming Interface (API) - Service Provider Interface (SPI) - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 62: Printer and Scanning Device Class Interface - Migration from Version 3.10 (CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 63: Identification Card Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 64: Cash Dispenser Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 65: PIN Keypad Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 66: Check Reader/Scanner Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 67: Depository Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 68: Text Terminal Unit Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 69: Sensors and Indicators Unit Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 70: Vendor Dependent Mode Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 71: Camera Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 72: Alarm Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 73: Card Embossing Unit Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 74: Cash-In Module Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 75: Card Dispenser Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 76: Barcode Reader Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference
Part 77: Item Processing Module Device Class Interface - Migration from Version 3.10 (see CWA 15748) to Version 3.20 (this CWA) - Programmer's Reference

In addition to these Programmer's Reference specifications, the reader of this CWA is also referred to a complementary document, called Release Notes. The Release Notes contain clarifications and explanations on the CWA specifications, which are not requiring functional changes. The current version of the Release Notes is available online from http://www.cen.eu/cen/pages/default.aspx.
The information in this document represents the Workshop's current views on the issues discussed as of the date of publication. It is furnished for informational purposes only and is subject to change without notice. CEN/ISSS makes no warranty, express or implied, with respect to this document.

The formal process followed by the Workshop in the development of the CEN Workshop Agreement has been endorsed by the National Members of CEN but neither the National Members of CEN nor the CEN-CENELEC Management Centre can be held accountable for the technical content of the CEN Workshop Agreement or possible conflict with standards or legislation. This CEN Workshop Agreement can in no way be held as being an official standard developed by CEN and its members.

The final review/endorsement round for this CWA was started on 2011-06-23 and was successfully closed on 2011-07-23. The final text of this CWA was submitted to CEN for publication on 2011-08-26.

This CEN Workshop Agreement is publicly available as a reference document from the National Members of CEN: Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland and the United Kingdom.

Comments or suggestions from the users of the CEN Workshop Agreement are welcome and should be addressed to the CEN-CENELEC Management Centre.

1. Introduction

1.1 Background to Release 3.20

The CEN/ISSS XFS Workshop aims to promote a clear and unambiguous specification defining a multi-vendor software interface to financial peripheral devices. The XFS (eXtensions for Financial Services) specifications are developed within the CEN/ISSS (European Committee for Standardization/Information Society Standardization System) Workshop environment. CEN/ISSS Workshops aim to arrive at a European consensus on an issue that can be published as a CEN Workshop Agreement (CWA).

The CEN/ISSS XFS Workshop encourages the participation of both banks and vendors in the deliberations required to create an industry standard. The CEN/ISSS XFS Workshop achieves its goals by focused sub-groups working electronically and meeting quarterly.

Release 3.20 of the XFS specification is based on a C API and is delivered with the continued promise for the protection of technical investment for existing applications. This release of the specification extends the functionality and capabilities of the existing devices covered by the specification, but does not include any new device classes. Notable major enhancements include Mixed Media processing to allow mixed cash and check accepting, as well as the addition of new commands to the CIM, PTR and IDC to allow better support of the Japanese marketplace.

1.2 XFS Service-Specific Programming

The service classes are defined by their service-specific commands and the associated data structures, error codes, messages, etc. These commands are used to request functions that are specific to one or more classes of Service Providers, but not all of them, and therefore are not included in the common API for basic or administration functions.

When a service-specific command is common among two or more classes of Service Providers, the syntax of the command is as similar as possible across all services, since a major objective of XFS is to standardize function codes and structures for the broadest variety of services. For example, using the \texttt{WFSExecute} function, the commands to read data from various services are as similar as possible to each other in their syntax and data structures.

In general, the specific command set for a service class is defined as a superset of the specific capabilities likely to be provided by the developers of the services of that class; thus any particular device will normally support only a subset of the defined command set.

There are three cases in which a Service Provider may receive a service-specific command that it does not support:

The requested capability is defined for the class of Service Providers by the XFS specification, the particular vendor implementation of that service does not support it, and the unsupported capability is \textit{not} considered to be fundamental to the service. In this case, the Service Provider returns a successful completion, but does no operation. An example would be a request from an application to turn on a control indicator on a passbook printer; the Service Provider recognizes the command, but since the passbook printer it is managing does not include that indicator, the Service Provider does no operation and returns a successful completion to the application.

The requested capability is defined for the class of Service Providers by the XFS specification, the particular vendor implementation of that service does not support it, and the unsupported capability is considered to be fundamental to the service. In this case, a \texttt{WFS_ERR_UNSUPP_COMMAND} error is returned to the calling application. An example would be a request from an application to a cash dispenser to dispense coins; the Service Provider recognizes the command but, since the cash dispenser it is managing dispenses only notes, returns this error.

The requested capability is \textit{not} defined for the class of Service Providers by the XFS specification. In this case, a \texttt{WFS_ERR_INVALID_COMMAND} error is returned to the calling application.

This design allows implementation of applications that can be used with a range of services that provide differing subsets of the functionalities that are defined for their service class. Applications may use the \texttt{WFSGetInfo} and \texttt{WFSAsyncGetInfo} commands to inquire about the capabilities of the service they are about to use, and modify their behavior accordingly, or they may use functions and then deal with \texttt{WFS_ERR_UNSUPP_COMMAND} error returns to make decisions as to how to use the service.
2. Alarms

This specification describes the functionality of the services provided by Alarms (ALM) under XFS, by defining the service-specific commands that can be issued, using the \texttt{WFSGetInfo}, \texttt{WFSAasyncGetInfo}, \texttt{WFSEexecute} and \texttt{WFSAasyncExecute} functions. This section describes the functionality of an Alarm (ALM) service that applies to both attended and unattended (self-service) devices.

The Alarm device class is provided as a separate service due to the need to set or reset an Alarm when one or more logical services associated with an attended CDM or unattended (self-service) device are locked. Because logical services can be locked by the application the Alarm is implemented in a separate device class to ensure that a set (trigger) or reset operation can be performed at any time.

1. XFS Application Programming Interface (API)/Service Provider Interface (SPI), Programmer’s Reference Revision 3.20
4. Info Commands

4.1 WFS_INF_ALM_STATUS

Description
This command is used to request the Alarm status.

Input Param
None.

Output Param
LPWFSALMSTATUS lpStatus;

typedef struct _wfs_alm_status
{
    WORD    fwDevice;
    BOOL    bAlarmSet;
    LPSTR   lpszExtra;
    WORD    wAntiFraudModule;
} WFSALMSTATUS, *LPWFSALMSTATUS;

fwDevice
Specifies the state of the alarm device as one of the following flags:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>WFS_ALM_DEVONLINE</td>
<td>The device is present, powered on and online (i.e. operational, not busy processing a request and not in an error state).</td>
</tr>
<tr>
<td>WFS_ALM_DEVOFFLINE</td>
<td>The device is offline (e.g. the operator has taken the device offline by turning a switch or pulling out the device).</td>
</tr>
<tr>
<td>WFS_ALM_DEVPOWEROFF</td>
<td>The device is powered off or physically not connected.</td>
</tr>
<tr>
<td>WFS_ALM_DEVNODEVICE</td>
<td>There is no device intended to be there; e.g. this type of self service machine does not contain such a device or it is internally not configured.</td>
</tr>
<tr>
<td>WFS_ALM_DEVUSERERROR</td>
<td>The device is present but a person is preventing proper device operation. The application should suspend the device operation or remove the device from service until the Service Provider generates a device state change event indicating the condition of the device has changed e.g. the error is removed (WFS_ALM_DEVONLINE) or a permanent error condition has occurred (WFS_ALM_DEVHWERROR).</td>
</tr>
<tr>
<td>WFS_ALM_DEVHWERROR</td>
<td>The device is present but inoperable due to a hardware fault that prevents it from being used.</td>
</tr>
<tr>
<td>WFS_ALM_DEVBUSY</td>
<td>The device is busy and unable to process an execute command at this time.</td>
</tr>
<tr>
<td>WFS_ALM_DEVFRAUDATTEMPT</td>
<td>The device is present but is inoperable because it has detected a fraud attempt.</td>
</tr>
<tr>
<td>WFS_ALM_DEVPOTENTIALFRAUD</td>
<td>The device has detected a potential fraud attempt and is capable of remaining in service. In this case the application should make the decision as to whether to take the device offline.</td>
</tr>
</tbody>
</table>

bAlarmSet
Specifies the state of the Alarm as either Reset (FALSE) or Set (TRUE).
**lpszExtra**

Pointer to a list of vendor-specific, or any other extended, information. The information is returned as a series of "key=value" strings so that it is easily extensible by Service Providers. Each string is null-terminated, with the final string terminating with two null characters. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

**wAntiFraudModule**

Specifies the state of the anti-fraud module as one of the following values:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>WFS_ALM_AFMMNOTSUPP</td>
<td>No anti-fraud module is available.</td>
</tr>
<tr>
<td>WFS_ALM_AFMMOK</td>
<td>Anti-fraud module is in a good state and no foreign device is detected.</td>
</tr>
<tr>
<td>WFS_ALM_AFMINOP</td>
<td>Anti-fraud module is inoperable.</td>
</tr>
<tr>
<td>WFS_ALM_AFMDEVDETECTED</td>
<td>Anti-fraud module detected the presence of a foreign device.</td>
</tr>
<tr>
<td>WFS_ALM_AFMMUNKNOWN</td>
<td>The state of the anti-fraud module cannot be determined.</td>
</tr>
</tbody>
</table>

**Error Codes**

Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Comments**

Applications which require or expect specific information to be present in the `lpszExtra` parameter may not be device or vendor-independent.

In the case where communications with the device has been lost, the `fwDevice` field will report WFS_ALM_DEVPOWEROFF when the device has been removed or WFS_ALM_DEVHWERROR if the communications are unexpectedly lost. All other fields should contain a value based on the following rules and priority:

1. Report the value as unknown.
2. Report the value as a general h/w error.
3. Report the value as the last known value.
### 4.2 WFS_INF_ALM_CAPABILITIES

**Description**
This command is used to retrieve the capabilities of the Alarm.

**Input Param**
None.

**Output Param**
LPWFSALMCAPS lpCaps;

```c
typedef struct _wfs_alm_caps {
    WORD    wClass;
    BOOL    bProgrammaticallyDeactivate;
    LPSTR    lpszExtra;
    BOOL    bAntiFraudModule;
} WFSALMCAPS, *LPWFSALMCAPS;
```

- **wClass**
  Specifies the logical service class as WFS_SERVICE_CLASS_ALM.

- **bProgrammaticallyDeactivate**
  Specifies whether the Alarm can be programmatically deactivated (TRUE) or can not be programmatically deactivated (FALSE).

- **lpszExtra**
  Pointer to a list of vendor-specific, or any other extended, information. The information is returned as a series of "key=value" strings so that it is easily extensible by Service Providers. Each string is null-terminated, with the final string terminating with two null characters. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

- **bAntiFraudModule**
  Specifies whether the anti-fraud module is available. This can either be TRUE if available or FALSE if not available.

**Error Codes**
Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Comments**
Applications which require or expect specific information to be present in the lpszExtra parameter may not be device or vendor-independent.
5. Execute Commands

5.1 WFS_CMD_ALM_SET_ALARM

<table>
<thead>
<tr>
<th>Description</th>
<th>This command is used to trigger an Alarm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Param</td>
<td>None.</td>
</tr>
<tr>
<td>Output Param</td>
<td>None.</td>
</tr>
<tr>
<td>Error Codes</td>
<td>Only the generic error codes defined in [Ref. 1] can be generated by this command.</td>
</tr>
<tr>
<td>Events</td>
<td>In addition to the generic events defined in [Ref. 1], the following events can be generated as a result of this command:</td>
</tr>
<tr>
<td></td>
<td>Value</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Comments</td>
<td>None.</td>
</tr>
</tbody>
</table>
5.2 WFS_CMD_ALM_RESET_ALARM

Description: This command is used to reset an Alarm.

Input Param: None.

Output Param: None.

Error Codes: Only the generic error codes defined in [Ref. 1] can be generated by this command.

Events: In addition to the generic events defined in [Ref. 1], the following events can be generated as a result of this command:

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>WFS_SRVE_ALMDEVICE_RESET</td>
<td>The alarm device has been reset.</td>
</tr>
</tbody>
</table>

Comments: None.
5.3 WFS_CMD_ALM_RESET

<table>
<thead>
<tr>
<th>Description</th>
<th>Sends a service reset to the Service Provider.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Input Param</td>
<td>None.</td>
</tr>
<tr>
<td>Output Param</td>
<td>None.</td>
</tr>
<tr>
<td>Error Codes</td>
<td>Only the generic error codes defined in [Ref. 1] can be generated by this command.</td>
</tr>
<tr>
<td>Events</td>
<td>Only the generic events defined in [Ref. 1] can be generated by this command.</td>
</tr>
<tr>
<td>Comments</td>
<td>This command is used by an application control program to cause a device to reset itself to a known good condition.</td>
</tr>
</tbody>
</table>
6. Events

6.1 WFS_SRVE_ALM_DEVICE_SET

<table>
<thead>
<tr>
<th>Description</th>
<th>The Alarm has been set (triggered) by an external event or a programmatic request to set (trigger) the Alarm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event Param</td>
<td>None.</td>
</tr>
<tr>
<td>Comments</td>
<td>None.</td>
</tr>
</tbody>
</table>
### 6.2 WFS_SRVE_ALM_DEVICE_RESET

<table>
<thead>
<tr>
<th><strong>Description</strong></th>
<th>The Alarm has been manually or programmatically reset.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Event Param</strong></td>
<td>None.</td>
</tr>
<tr>
<td><strong>Comments</strong></td>
<td>None.</td>
</tr>
</tbody>
